# PRODUCT GUIDE

This Product Guide provides short-form information on all Veracity IP Transmission Products and is intended as a useful product comparison and product overview.

**A full datasheet for each product is available on the Veracity website [www.veracityglobal.com](http://www.veracityglobal.com)**

Each product has an example application diagram which illustrates how the product might be connected. Further application diagrams can be found in the datasheets and on the website.

**POE** (Power Over Ethernet) is a core feature of most modern IP installations, so we have provided a useful reference table on page 4 which shows the POE Classes, IEEE standard, the power levels at the **PSE** (Power Sourcing Equipment) and the maximum power which can be delivered at the **PD** (Powered Device).

For more information of POE and how it works, please visit our website. Use the Power Sources key on page 2, to know which sources can be used with each product, as indicated throughout the guide.

### LONGSPAN® MAX

The LONGSPAN Max variants are high power versions of the LONGSPAN family, with the same extreme 820m network data range. The Max devices are IEEE 802.3bt compliant, which is the highest POE power standard of 90W.

Please see the POE Reference Table on Page 4. POE levels are set for the standard Ethernet distance of 90m.

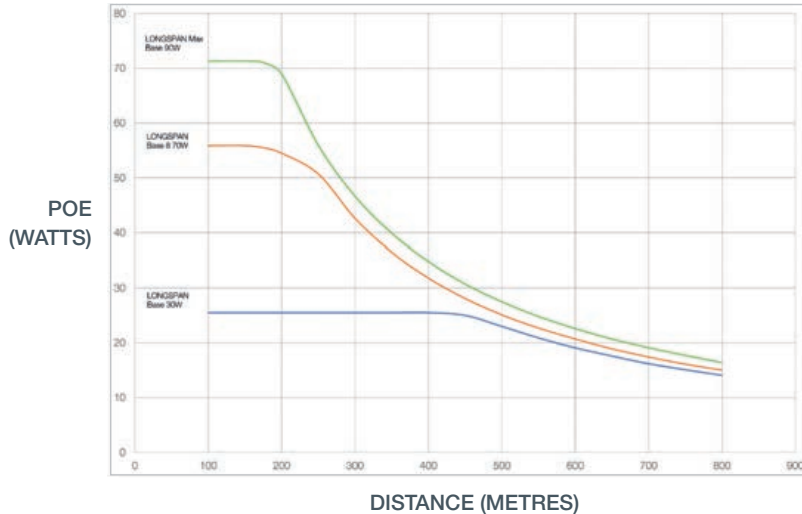

Veracity products such as OUTREACH and LONGSPAN overcome distance limitations, but are still subject to normal power losses in the cabling.

While LONGSPAN Max can output 90W, the POE delivered to the PD drops quickly with distance, as shown in the comparison graph. LONGSPAN (30W) and LONGSPAN Base 8

Hi-Power (70W). Note: At 450m - 500m, the power curves converge and so the higher power delivery advantage of LONGSPAN Max is minimised at longer distances.

For maximum power delivery at very long distances, a local PSU for LONGSPAN Max or Max Quad at the camera end is recommended. See product datasheets for full and detailed information.

## THE IMPORTANCE OF ACCURATE TIME

# Time Synchronisation and NTP explained

**“All CCTV and video management system installations require accurate reference time signals for synchronisation of system clocks to ensure that they are always set at precisely the correct time and recorded evidence is accurately time-stamped”**

Video surveillance systems can ultimately prove what happened, where it happened, exactly when it happened, and nowadays is usually able to provide information to help identify the persons and/or vehicles involved. Thus such recordings must be evidentially robust. The requirements for evidentially robust recordings include verifiable time stamps. However, sometimes even the most sophisticated, high-end CCTV and VMS installations can be let down by something as simple as having the clocks set at the incorrect time. All VMS systems run on NVRs or servers with internal clocks which drift out of sync over time. It is also a fact that the evidential value of CCTV recordings is severely reduced if the recorded time stamps are not correct.

The traditional solution to providing an accurate reference time has been to use an atomic clock radio receiver or GPS sensor linked to an expensive rack-mounted master clock server, separately powered and

sometimes only with a serial output to a separate server for NTP transmission. Consequently smaller VMS installations tend not to have a reference time server at all or are insecurely linked to the internet to get a time signal, leaving the systems open to cyberattack.

TIMENET Pro integrates the GPS receiver and master NTP time server into a single POE-powered cyber-secure device which is directly connected to the network and can be used as a closed system. TIMENET Pro is extremely compact, can be wall-mounted, uses very little power, is very reliable over many years and is less than half the cost of competing solutions.

### **About NTP**

NTP stands for Network Time Protocol and is a universal standard for time synchronisation of computers or other devices on a network. TIMENET Pro is NTP-compatible and acts as a time server for any NTP-enabled client.

### **About UTC Time**

Universal co-ordinated time is an official worldwide atomic clock standard for time, agreed by national standards around the world.

### **About GPS**

GPS is a global satellite system used primarily for position location, using very accurate atomic clock references. GPS signals are far less prone to interference than traditional national radio clock signals. Thus TIMENET Pro is a universal solution which can be used anywhere in the world.

### **About Time Zone**

UTC is effectively a GMT reference time and TIMENET Pro provides this via NTP as a universal reference. All data is recorded with a UTC time reference. It's the task of the network device (server or PC) to define the local time zone setting for the country or zone location, including local or national variations to daylight savings time or equivalent.
